

Google Web Fonts

It's quite easy to use Google Fonts in Tiki!

How to configure

The screenshot shows a user interface for theme customization. At the top, there is a navigation bar with tabs: Theme, General Layout, Shadow layer, Pagination, UI Effects, and Customization. The Customization tab is currently selected.

Below the navigation bar, there is a section titled "Theme Generator (Experimental)". It contains a checkbox labeled "Theme Generator" and two small icons: a question mark and a warning sign.

Under "Custom Codes", there is a "Custom CSS" section with a "Change Highlighter" button. The CSS code is:

```
html, a, p, body, input, textarea, select { font-family: 'Griffy', cursive; }
```

Below this, there is a note: "Experimental: CSS assistant (work in progress - click the x to remove)" followed by a "Custom HTML <head> Content" section with its own "Change Highlighter" button. The HTML code is:

```
<link href='http://fonts.googleapis.com/css?family=Griffy' rel='stylesheet' type='text/css'>
```

To affect most of the text

html > body, *:first-child + html body
