

# Google Web Fonts

It's quite easy to use [Google Fonts](#) in Tiki!

See also: [PluginFont](#)

## How to configure

The screenshot shows the 'Theme' tab selected in the top navigation bar. Below it, there's a 'Theme Generator (Experimental)' section with a checkbox for 'Theme Generator' and two status icons. Under 'Custom Codes', there's a 'Custom CSS' section containing the following code:

```
html, a, p, body, input, textarea, select { font-family: 'Griffy', cursive; }
```

Below this, there's a 'Change Highlighter' button and a note about an experimental CSS assistant. In the 'Custom HTML <head> Content' section, there's a link tag pointing to Google's font API:

```
<link href='http://fonts.googleapis.com/css?family=Griffy' rel='stylesheet' type='text/css'>
```

**To affect most of the text**

```
html > body, *:first-child + html body
```
